

- GSM
  - Mobile device gets exclusive signal from the base station
  - Number of devices in a cell does not influence cell size
- UMTS
  - Cell size is closely correlated to the cell capacity
  - Signal-to-noise ratio determines cell capacity
  - Noise is generated by interference from
    - other cells
    - other users of the same cell
  - Interference increases noise level
  - Devices at the edge of a cell cannot further increase their output power (max. power limit) and thus drop out of the cell  
 $\Rightarrow$  no more communication possible
  - Limitation of the max. number of users within a cell required
  - Cell breathing complicates network planning

## Breathing Cells: Example

## WCDMA Principle: Power Control

(Slide source: Nokia/NRC guest lectures Mobile Communication 2001-2005)

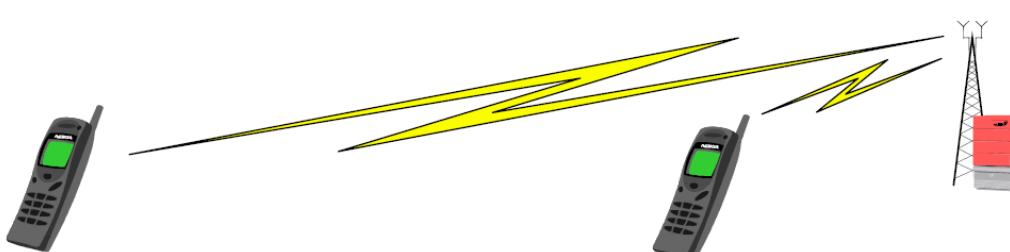

Mobile Communication  
Chapter 7.

43

## Power Control: Motivation

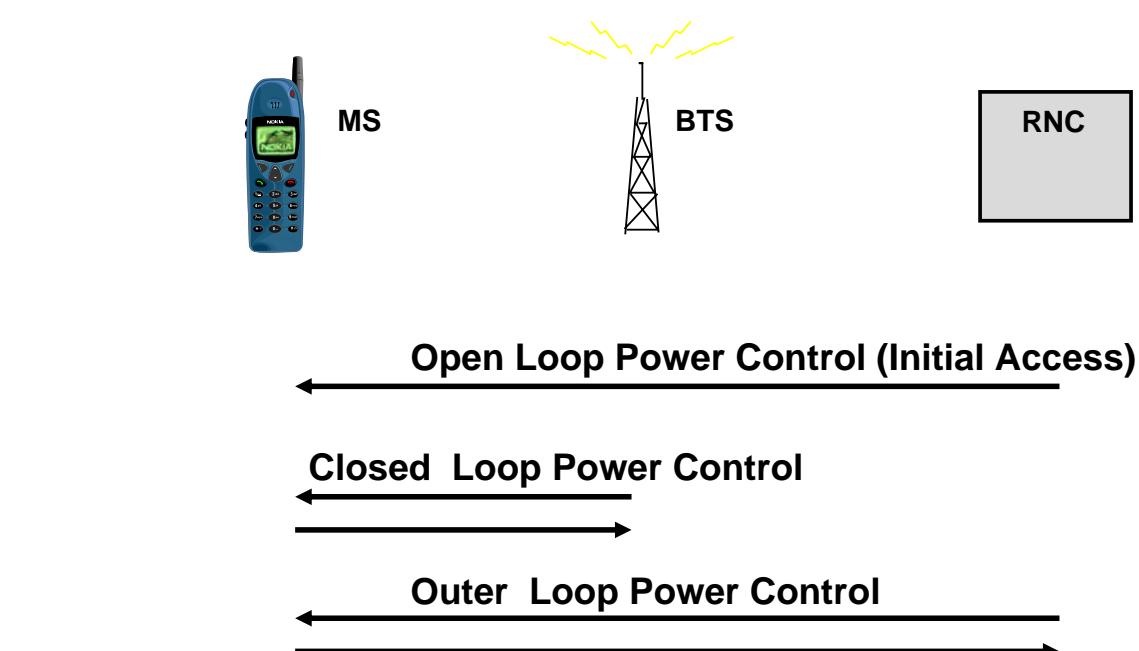

### Power Control

- Target is to equalize received power per bit of all users
- In downlink base station uses same power level for all users
  - "worst" user determines power level of whole cell
- In uplink all users send on the same frequency:  
Base station needs to receive all signals on same level
  - near users can easily overshoot far users (near-far problem)
  - a single over-powered user could block a whole cell

## WCDMA Principle: Power Control (2)

### Power Control (PC) Loops in WCDMA

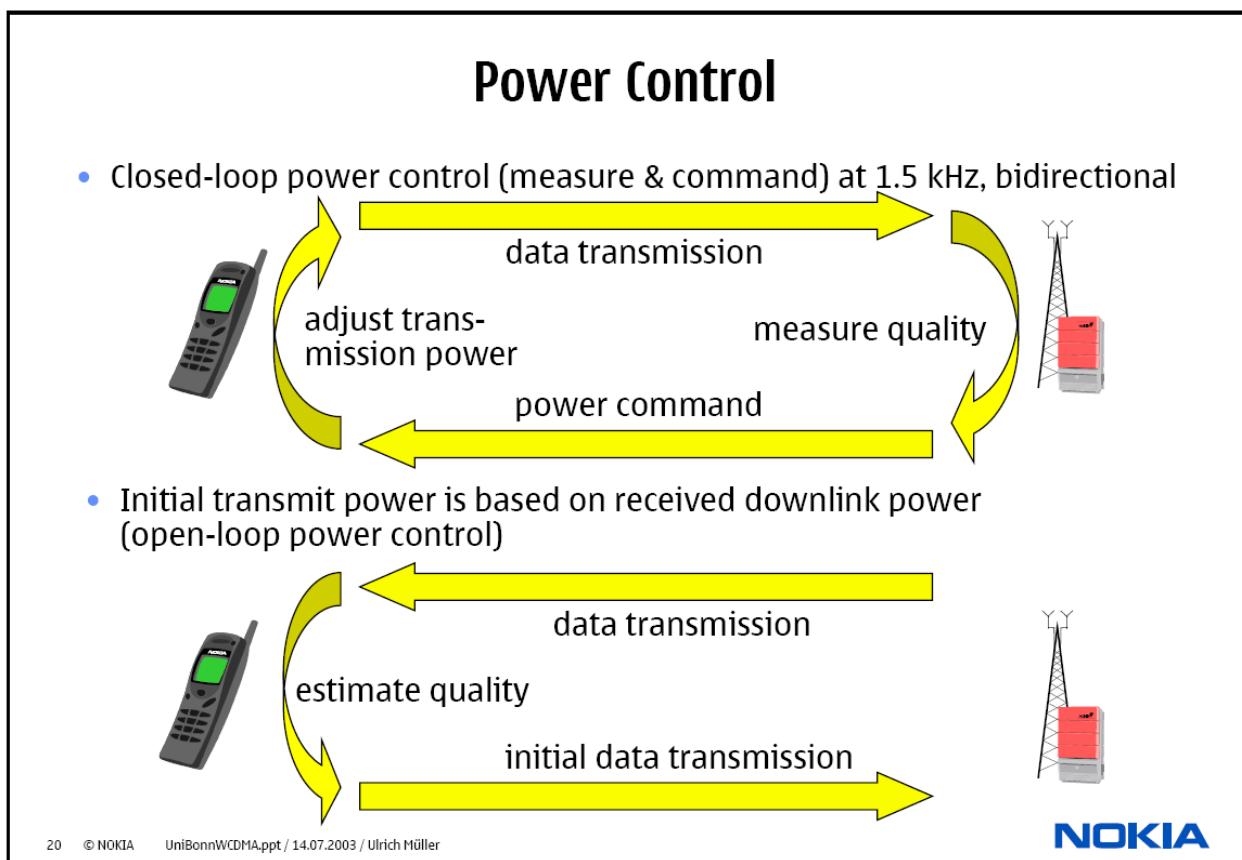

(Slide source: Nokia/NRC guest lectures Mobile Communication 2001-2005)

Mobile Communication  
Chapter 7.

45

## Closed-loop vs. open-loop

- GSM
  - **EMS/MMS**
    - EMS: 760 characters possible by chaining SMS, animated icons, ring tones, was soon replaced by MMS (or simply skipped)
    - MMS: transmission of images, video clips, audio
  - **EDGE (Enhanced Data Rates for Global [was: GSM] Evolution)**
    - 8-PSK instead of GMSK, up to 384 kbit/s
    - new modulation and coding schemes for GPRS → EGPRS
      - MCS-1 to MCS-4 uses GMSK at rates 8.8/11.2/14.8/17.6 kbit/s
      - MCS-5 to MCS-9 uses 8-PSK at rates 22.4/29.6/44.8/54.4/59.2 kbit/s
- UMTS
  - **HSDPA (High-Speed Downlink Packet Access)**
    - initially up to 10 Mbit/s for the downlink, later on 20 Mbit/s using MIMO- (Multiple Input Multiple Output-) antennas
    - uses 16-QAM instead of QPSK

### Example: EDGE coverage for T-Mobile Germany

EDGE is available in the complete GSM network of T-Mobile.

# High Speed Downlink Packet Access

- High Speed Downlink Packet Access (HSDPA)
  - High Speed Data Packet Access channel introduced as an add on for UMTS services (up to 8-14 Mbit/s downlink shared channel)
  - Transmitted within one cell “eating up” certain amount of codes in SF=16
  - New modulation schemes to achieve more bandwidth
  - Priority classes on HSDPA channels allow prioritising certain users within the shared group
- Added to 3GPP Release 5 specifications
  - Support an evolution towards more sophisticated network and multimedia services
  - The main target of HSDPA is to increase user peak data rates, quality of service
  - Generally improve spectral efficiency for downlink asymmetrical and bursty packet data services.

## 7.8. IP Multimedia Subsystem (IMS)

IMS\* represents an overlay network on top of cellular networks and provides an all IP service delivery environment for mobile multimedia service provision.

\* IMS is the “IP Multimedia System”, standardised by the 3rd Generation Partnership Projekt (3GPP), <http://www.3gpp.org>

### Why do we Need an IMS?

- SIP, and SDP for Session Control
- DIAMETER for accounting
- RTP, RTCP for multimedia data transport
- COPS for policy provisioning
- plus many others

IMS is designed for IPv6, but support for IPv4 has been added in Version 6 of IMS

- IMS builds on IETF protocols, to create a **robust** and **complete** multimedia system
- IMS defines common interfaces to adopt new and **integrated application services**
- IMS enhancements and operational profiles provide support for operator control, **charging and billing**, and **security**
- IMS provides **QoS**, **single sign-on**, **subscription**, **presence**, and **location**

Mobile Communication  
Chapter 7.

51

## IMS – IP Multimedia Subsystem

The IMS “service platform” is/was designed by 3GPP (<http://www.3gpp.org>) to assist and control (multimedia) sessions established between peers. The peers willing to involve IMS in their sessions must us some of the IMS nodes as proxies for their session signaling.

## 7.9. Mobile Future: 3.5G ... 3.9G ... 4G ...

**3.5 generation** of mobile communication:

- **HSDPA/HSUPA** (D = downlink, U = uplink) extension to UMTS
- Downlink up to 14.4 Mbit/s, Uplink up to 5.7 Mbit/s

**3.9 generation** of mobile communication:

- **UTRAN LTE** ("Universal Terrestrial Radio Access Network Long Term Evolution")
- also: "Super 3G"
- Downlink up to 100 Mbit/s, Uplink up to 50 Mbit/s
- 3GPP 3.9G specification approved 2nd half of 2007

**4th generation** of mobile communication:

- **All-IP based**
- NTT DoCoMo (Japan) testing since 1998
- data transfer rates 100 Mbit/s up to 300 Mbit/s

## Future statement as of June 2008

More on

[http://www.computerzeitung.de/articles/tage\\_von\\_wimax\\_und\\_wlan\\_gezaehlt/2008025/31545147\\_ha\\_CZ.html?thes=or](http://www.computerzeitung.de/articles/tage_von_wimax_und_wlan_gezaehlt/2008025/31545147_ha_CZ.html?thes=or) or <http://www.computerzeitung.de/kn31539662>

The screenshot shows a news article from Computer Zeitung. The headline reads: "Tage von Wimax und WLAN gezählt". The text discusses how next-generation technologies like HSDPA+ and LTE will render WLAN and WiMAX obsolete. It quotes Qualcomm CEO Paul Jacobs as saying: "Tage von Wimax und WLAN gezählt". The page also features advertisements for Microsoft Dynamics and Windows IT Pro.

"WLAN and WiMAX's days are numbered"

**Next generation technologies** of mobile communication will make technologies like **WLAN, WiMAX, ... obsolete**:

- HSDPA+
- LTE

using

- MIMO (multiple input multiple output) antennas
- OFDM

(Qualcomm CEO Paul Jacobs, June 2008)

## Annex: Ergebnis Frequenzvergabe für UMTS – FDD (1) (in German language)

RUNDENERGEBNIS				
Versteigerung UMTS/IMT-2000-Lizenzen				
Runde:	173			
Lfd. Nr.	Umfang	Höchstbieter	Höchstgebot (TDM)	Höchstgebot* (€ in Tsd)
01	2 x 5 MHz	VIAG Interkom	8.310.400	4.249.040
02	2 x 5 MHz	MobilCom Multimedia	8.170.000	4.177.255
03	2 x 5 MHz	Mannesmann Mobilfunk	8.330.000	4.259.061
04	2 x 5 MHz	Group 3G	8.304.600	4.246.075
05	2 x 5 MHz	MobilCom Multimedia	8.200.000	4.192.593
06	2 x 5 MHz	VIAG Interkom	8.206.600	4.195.968
07	2 x 5 MHz	T-Mobil	8.304.300	4.245.921
08	2 x 5 MHz	E-Plus Hutchison	8.274.300	4.230.582
09	2 x 5 MHz	T-Mobil	8.277.900	4.232.423
10	2 x 5 MHz	E-Plus Hutchison	8.143.900	4.163.910
11	2 x 5 MHz	Mannesmann Mobilfunk	8.143.800	4.163.859
12	2 x 5 MHz	Group 3G	8.141.400	4.162.632

\* Eurowerte gerundet

Summe Höchstgebote 98.807.200 50.519.319

## UMTS-Versteigerung Deutschland

14. Tag = 17.08.2000 (bis Runde 173)

- UTRA-FDD:
  - Uplink 1920-1980 MHz
  - Downlink 2110-2170 MHz
  - Duplexabstand 190 MHz
  - 12 Kanäle zu je 5 MHz

Chapter 7.

## Ergebnis Frequenzvergabe für UMTS – TDD

RUNDENERGEBNIS					
Versteigerung UMTS/IMT-2000-Frequenzen					
Runde:	9	Höchstbieter	Höchstgebot (TDM)	Höchstgebot* (€ in Tsd)	
13	1 x 5 MHz konkret	E-Plus Hutchison	73.600	37.631	
14	1 x 5 MHz	MobilCom Multimedia	121.000	61.866	
15	1 x 5 MHz	T-Mobil	122.700	62.736	
16	1 x 5 MHz	Mannesmann Mobilfunk	121.000	61.866	
17	1 x 5 MHz	Group 3G	122.700	62.736	
* Eurowerte gerundet					
VIAG Interkom			Summe Höchstgebote	561.000	286.835
ausgeschieden					

- UTRA-TDD:
  - 1900-1920 MHz,
  - 2010-2025 MHz;
  - je 5 MHz Kanäle

## Ziel gemäß Lizensierung:

- Abdeckung: 25% in der Bevölkerung bis 12/2003, 50% bis 12/2005

## UMTS-Versteigerung Deutschland

1. Tag = 18.08.2000 (bis Runde 9)
